(54) LIQUID CRYSTAL DISPLAY DEVICE**(57)Abstract:**

PURPOSE: To obtain a display free from flickering by forming two transistors (TRs) in a region where a gate electrode is formed and acting these TRs as the TR within one cell.

CONSTITUTION: A gate 13 is provided to project from a gate line 11. Two pieces of laminates of non-doped non-single crystalline silicon films 17, 18 and non-single crystalline silicon films 19, 20 doped with an impurity serving as one constitution of the TRs are provided at an equal interval in this region. A source electrode 24 which is integral with a display electrode 15 or is electrically connected to the display electrode 15 is provided in the opposite regions of these two laminates. Drain electrodes 21, 22 which are integral with a drain line 23 or are electrically connected to the drain line 23 are provided on the respective laminates facing the regions provided with this source electrode 24. The superposing area of the source electrode 24 and the gate electrode 13 is, therefore, the same even if the patterns of the display electrode 15 which is the source electrode deviates.
